

Splunk universal forwarder

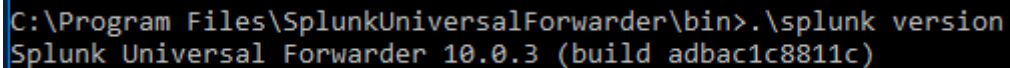

Splunk Universal Forwarder 10.2.1 for Windows and Splunk Universal Forwarder 10.0.3 for Windows were downloaded and configured on the two Windows 10 virtual machines and Windows Server 2016, respectively. Whereas Splunk universal forwarder 10.2.0 was originally earmarked for download, the 10.2.1 version subsequently became available. As it is interoperable with the the Splunk Enterprise indexer and Edge Processor on the Splunk Enterprise 10.2.1, the latest version was opted for. Install UniversalForwarder as Local system was selected, and all the log sources available were checked. The Deployment Server IP address was specified as 10.0.10.27 with port 8089 and the Receiving Indexer IP address as 10.0.10.27 with port 9997. After the installation finished, the versions were validated with the commands listed below.

```
cd \Program Files\SplunkUniversalForwarder\bin  
  
.\splunk version
```

```
C:\Program Files\SplunkUniversalForwarder\bin>.\splunk version  
Splunk Universal Forwarder 10.2.1 (build c892b66d163d)
```

```
C:\Program Files\SplunkUniversalForwarder\bin>.\splunk version  
Splunk Universal Forwarder 10.0.3 (build adbac1c8811c)
```

Figure 2: Verification of the Splunk Universal Forwarder version 10.0.3 on the Windows Server 2016 machine

Subsequently, it was verified that each forwarder was connected to the indexer using the output of the command `splunk list forward-server`.

```
C:\Program Files\SplunkUniversalForwarder\bin>splunk list forward-server  
Your session is invalid. Please login.
